SUMMARY

Full-stack developer and BSc Cybersecurity student at the University of Mines and Technology (UMaT). I learn by building real projects with React, TypeScript, Next.js, Supabase and Cloudflare Workers, then pentesting and debugging them while people use them. Currently building web apps for small business clients. Eager to keep learning in remote software engineering work.

PROJECTS

2026 – Present **Bedarts POS and online store**

Point-of-sale and ordering system for a cold store, in daily use for a month (Next.js, TypeScript, Supabase, Cloudflare)

- Built the till to work offline: a queued sale leaves the device only after the server confirms it, and an idempotency key stops retries from recording a sale twice.
- Closed security holes found in review: signup that let anyone make themselves admin, public access to sale and stock functions and to cost prices, and customer-set order prices.
- Debugged end-of-day cash reconciliation and refunds in live use, including refunds charged to the wrong payment method and row-level-security reads that silently returned nothing. 22 Playwright tests cover the till on desktop and mobile.

2026 **Carrington Express**

Intercity bus booking app, launched in September (React 19, TanStack Start, Cloudflare Workers, Supabase)

- Built Paystack checkout with a signature-verified webhook, and Postgres seat locking to prevent double booking.
- Added ticket emails, QR ticket scanning, automatic cancellation of stale bookings and Turnstile on forms.

2026 – Present **RapidBoost**

Social media marketing platform for Ghana (TanStack Start, Supabase, Firebase)

- Pentested my own platform and fixed the findings: a storage bucket anyone could read and write (now private, with signed URLs), anonymous access to pricing functions, and supplier details leaking in API responses.
- Replaced a racy rate limiter with an atomic advisory-lock check and confirmed it holds under 25 simultaneous requests. Added a domain allowlist to stop an open redirect.
- Fixed money bugs: wallet refunds when an order insert fails, and an admin profit chart that counted unpaid and refunded orders as revenue. Covered by 59 unit tests and Playwright tests, plus k6 load tests that refuse to run against production.

2026 – Present **Hair Relief**

E-commerce store for a hair and wig brand (React, TanStack Start, Supabase, Cloudflare Workers)

- Built a mobile-first shop with guest checkout, pay on delivery and an admin area. Fixed a database join that crashed checkout site-wide and admin pages that would not render.

SECURITY EXPERIENCE

2026 **Mobile app security assessment (academic project):** assessed a food-delivery app and documented multiple CVEs/CWEs, including a denial-of-service flaw and insecure token storage.

2024 – Present **Home security lab:** Wazuh SIEM, Kali Linux and Metasploitable 2 for practising penetration testing.

EDUCATION

2024 – Present **University of Mines and Technology (UMaT), Tarkwa**: BSc Cybersecurity (Year 3)
Courses: Penetration Testing, Cryptography, Business Entrepreneurship

2019 – 2022 **Aggrey Memorial A.M.E. Zion Senior High School, Cape Coast**: WASSCE, General Arts

WORK EXPERIENCE

2023 – Present **Cashier**, Bedarts Cold Supplies, Tema (vacation periods). Handled cash and mobile money for over 150 customers a day with no reconciliation shortfalls.

SKILLS

Development TypeScript, JavaScript, Node.js, React, Next.js, TanStack Start, SQL (Postgres, RLS), Supabase, Cloudflare Workers, Tailwind CSS, Playwright, Vitest, k6, Python

Security Burp Suite, Kali Linux, Nmap, Metasploit, Wireshark, Wazuh

Languages English (fluent), Twi (conversational)
